Notes 4

How to install and remove software using APT command

APT (Advanced Package Tool) is the package manager used in Ubuntu and Debian-based Linux systems. It helps you install, update, remove, and manage software from the terminal.

Step 1: Update the Package List Before installing any software, update the package list so your system knows about the latest versions.

- `sudo apt update`

Step 2: Install Software To install software, use the install command. Example: Installing git

- `sudo apt install git` You will be asked to confirm installation. Press: Y

Step 3: Check if the Software is Installed After installation, verify it.

- `git --version`

Step 4: Remove Software To remove software but keep configuration files:

- `sudo apt remove git`

Step 5: Remove Software Completely To remove software including configuration files:

- `sudo apt purge git`

Step 6: Clean Unused Packages After uninstalling software, you can remove unnecessary dependencies.

- `sudo apt autoremove`

How to create a shell script step by step including screenshots and how to run it. Try to be as detailed as possible.

A shell script is a file containing commands that the Linux shell executes automatically.

Step 1: open the text editor, create a script. script

Step 2: Save the script.

step 3: Run the script in terminal. `Hello World This is my first shell script Sun Mar 9 12:30:45 username`
